Gazebo Assembly
Support Beam Installation
April 2012

The beam is used on the open side of the gazebo and supports the weight of the roof over the open area. It attaches to the corner or extension panel.

There are 3 holes in the bracket that connects the beam to the corner or extension panel. Flush the beam to the outside and to the top of the corner or extension panel. Mark the spot of the center hole. Drill a 5/16" through the vertical member of the corner or extension panel. Install the 1/4 x 20 x 1" button socket bolt from the corner / extension panel side and secure with 1/4" hex flange nut. Install 2 each, #8 x 1" screws in upper and lower holes of the bracket.

Repeat steps on opposite side.
